

Turf Services Performed Today

____/____/____

Round #1: Please Stay Off Treated Areas Until Dry

____ **Fertilization:** A balanced granular product containing fast and/or slow release nutrients was applied to your lawn.

____ **Broadleaf Weed Management:** A liquid selective herbicide was applied to broadleaf weeds actively growing. This product will usually be effective upon drying within 1-3 hours. It is recommended that you **DO NOT water immediately after application for best results.**

____ **Seeding:** A professional blend of certified seed was applied today in conjunction with one or more of the following methods. **Seeded areas should be kept moist for 15 to 30 days for best germination results. (See notes below).**

____ **Overseed** ____ **Spot/Detail** ____ **Slice Seeding** ____ **Raking/Tilling**

Beneficial Applications If Performed:

____ **Core Aeration:** Breaks through thatch, relieves compaction and opens up soil to allow for air, water, and nutrients to get where needed the most. Greatly enhances seed to soil contact and root development.

Round #1 Turf Care Notes:

The fertilizer applied will green your lawn quickly once temperatures are consistently milder. The herbicide applied for Broadleaf Weed control is generally a spot spray and not an overspray. Moisture contained within the soil and early spring rains will usually be adequate for germination of any seed that was applied once soil temperatures become warm enough as spring moves on. Generally, insect or disease problems are not issues in early spring.

There is not much need for any irrigation/watering at this time of the year. Irrigation can be incorporated in mid-April to mid-May at the earliest, utilizing a once-a-week schedule. Unless extreme dry conditions exist, a quarter to half inch of rain/water on average per week is generally adequate.

Please contact Client Services if you have any questions regarding this service.
